# Outline

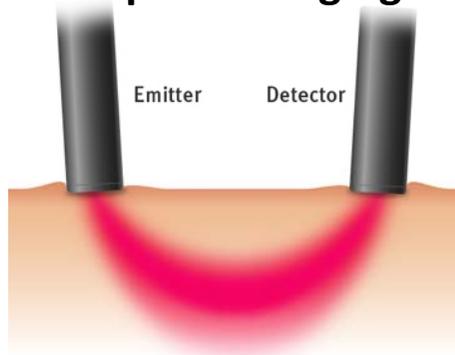

- Introduction of Ultrasound Image
- Image Based on a Generalized Rayleigh Distribution
- Applications
- Concluding Remarks

# Introduction of Ultrasound Image

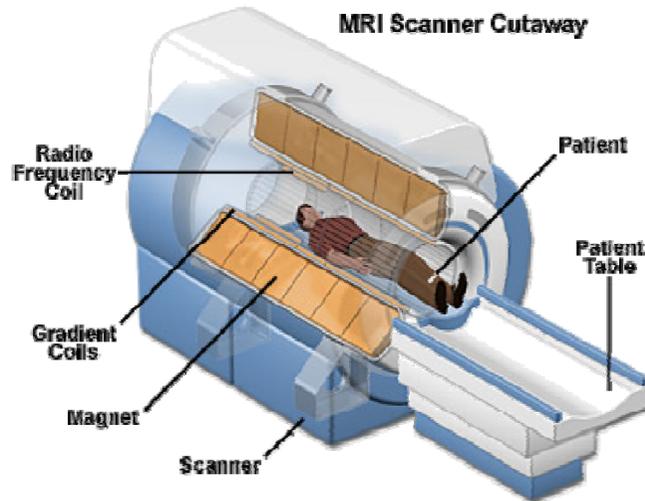

- Medical Imaging
- Advantages and disadvantages
- How to create an ultrasound image

# Medical Imaging

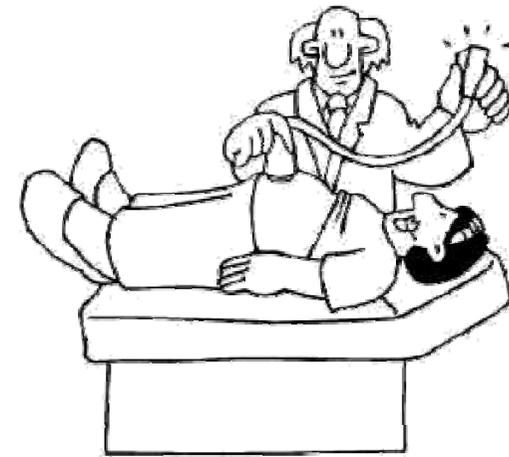

## Optical imaging

## X-ray imaging

## MRI imaging

## Ultrasound image

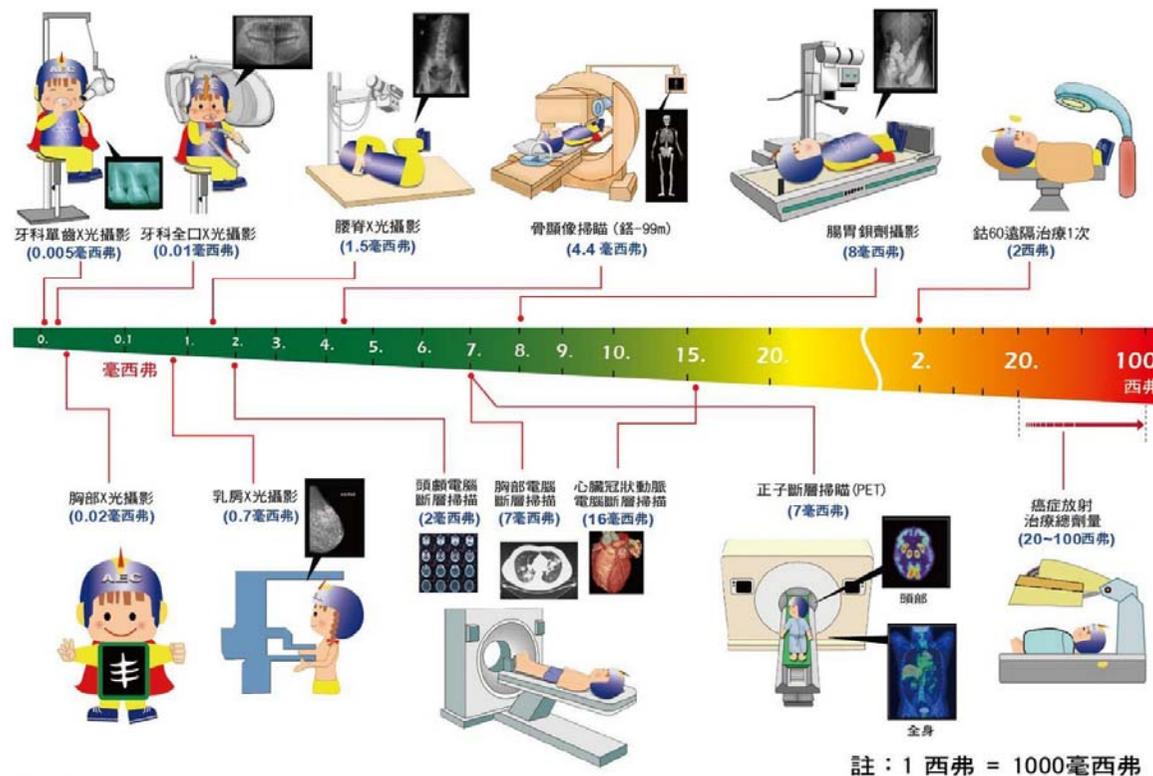

# X-Ray Imaging

# Radiation of X-Ray imaging

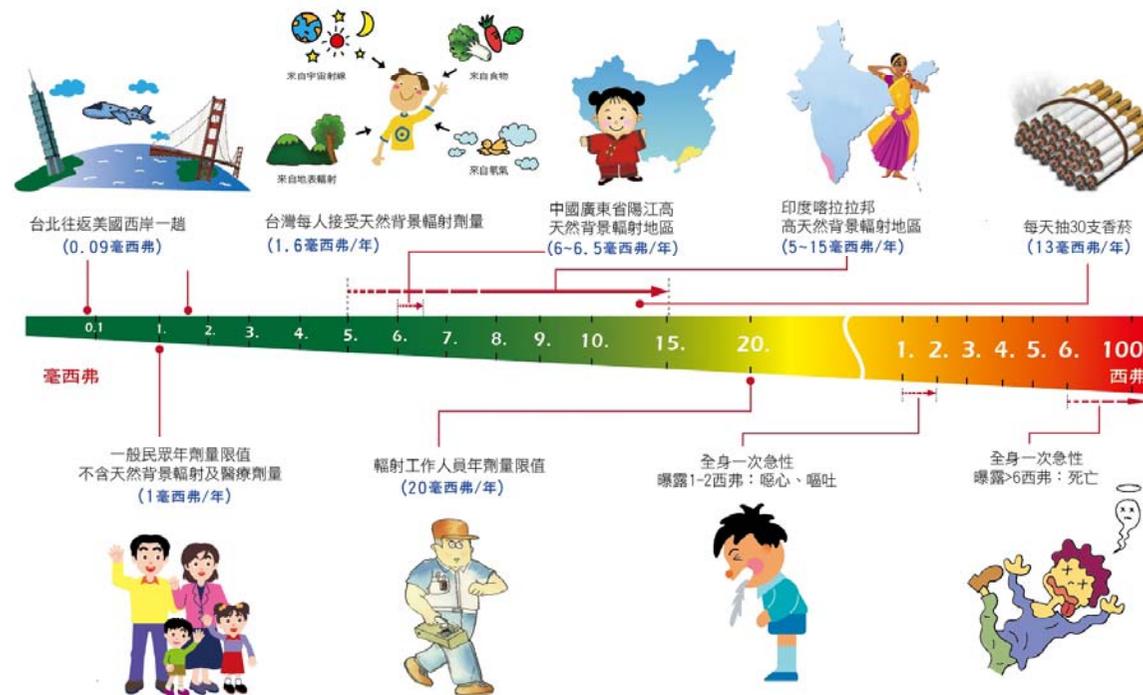

醫療游離輻射劑量比較圖

行政院原子能委員會 製作

# The effects of Radiation

一般游離輻射劑量比較圖

行政院原子能委員會 製作

註：1 西弗 = 1000毫西弗

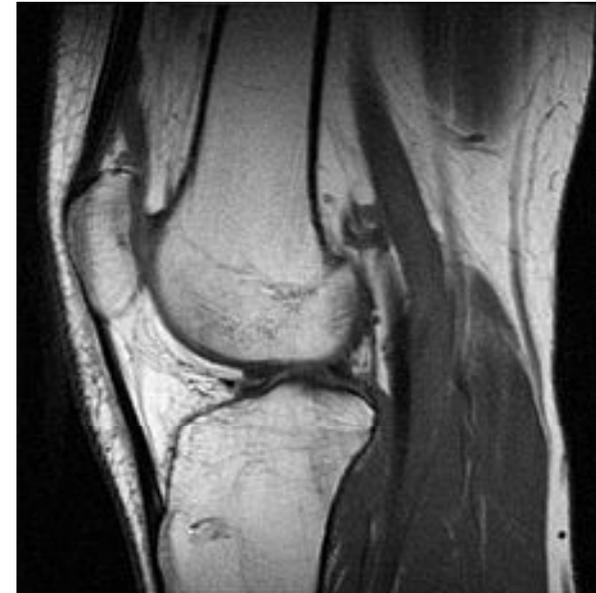

# Trade-off of X-Ray imaging

- Relatively low-cost investigation with a high diagnostic
  - Chest X-Ray, bony fractures, bony pathology, foreign objects, dental radiography, Computed tomography (CT)

# MRI imaging

## Advantage

- non-ionizing radiation
- Best suited for soft tissue
- For brain, MRI is superior

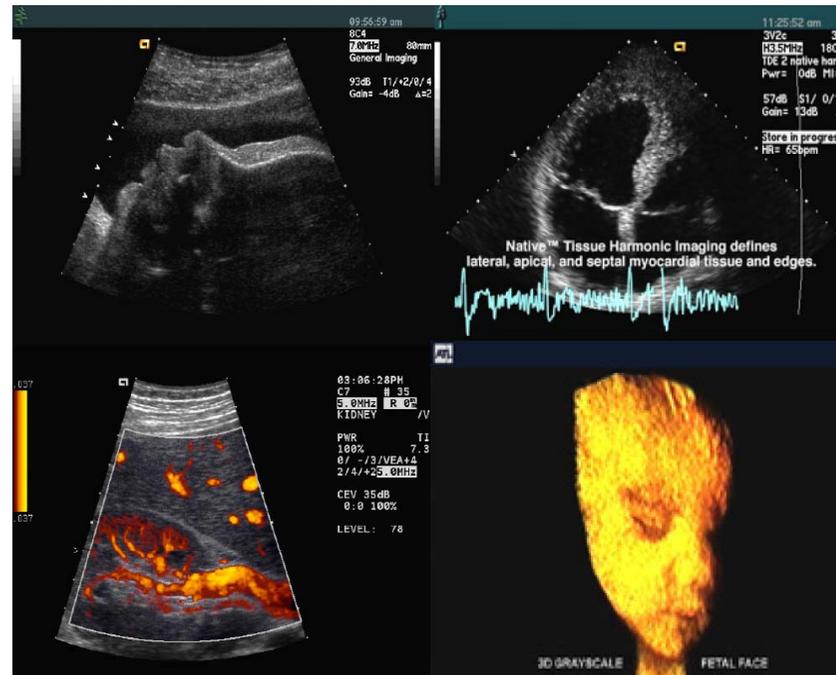

## Disadvantage:

- Expensive
- Not portable
- Suffers from motion artifacts

# Advantages of ultrasound imaging

- Noninvasive
- Soft tissues
- Real time
- Portable
- Non-ionizing
- Good resolution

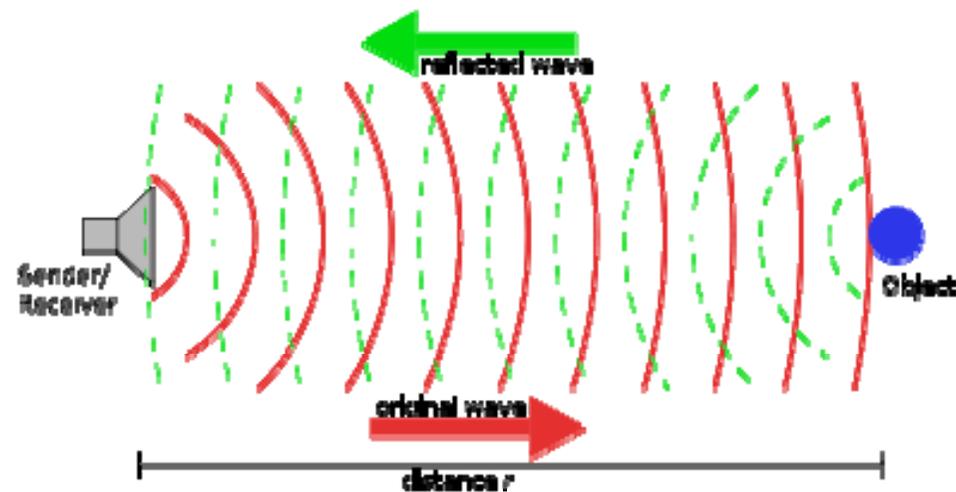

# Weaknesses of ultrasound imaging

- Penetrating bone: transcranial ultrasonography
- Gas: lung imaging is not possible
- Depth may be limited for obese patients
- Operator-dependent
- The location is determined under the assumption that sound speed is fixed.

# Create an ultrasound image

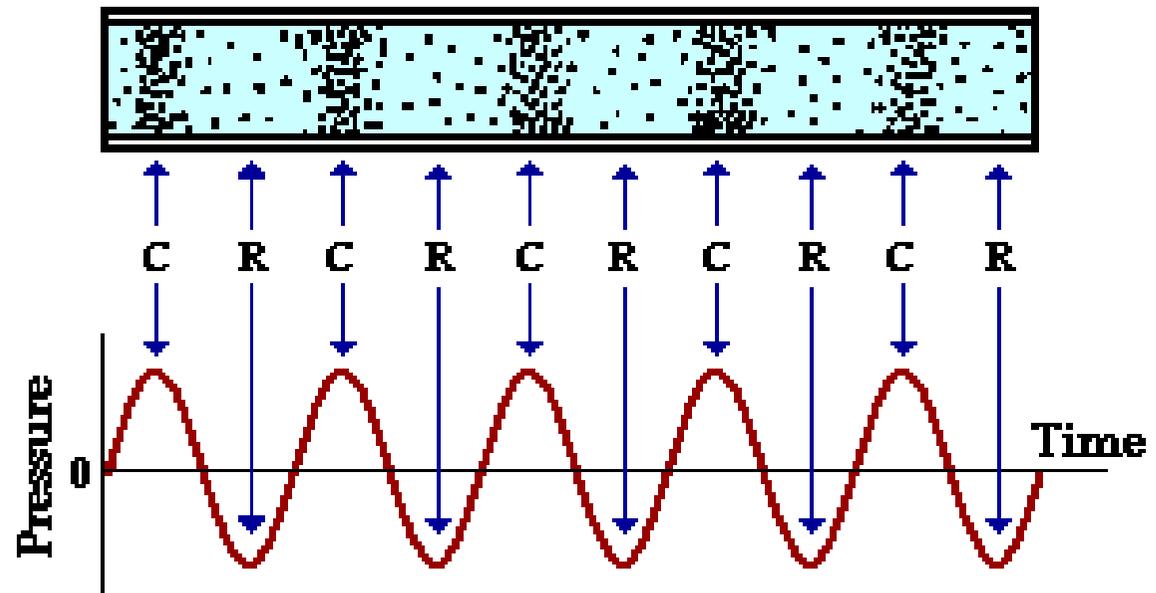

- Producing a sound wave
- Receiving echoes
- Interpreting those echoes

# Sound wave

Sound is a Pressure Wave

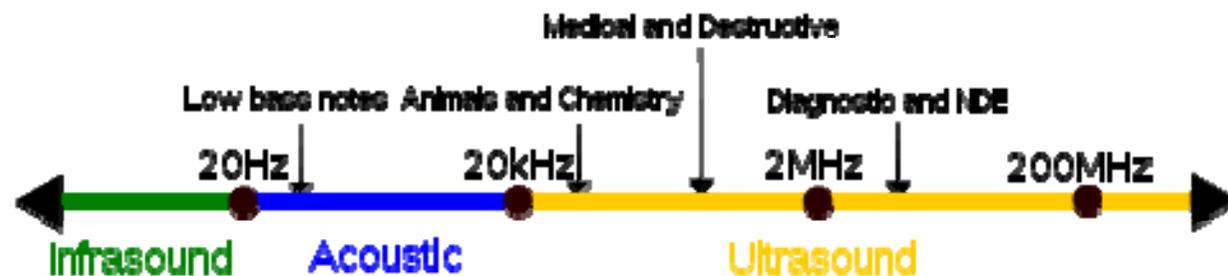

NOTE: "C" stands for compression and "R" stands for rarefaction

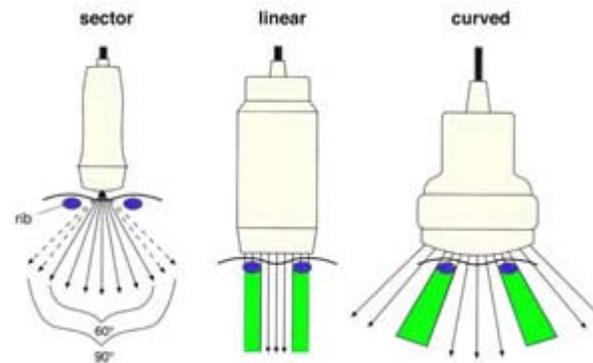

# Ultrasound

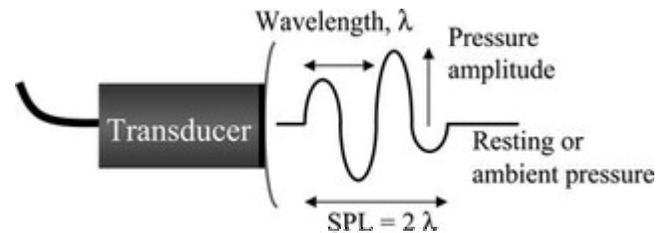

- Acoustic waves with frequencies higher than 20 kHz
- Need a medium to propagate
- Longitudinal wave
- Non-ionizing radiation

# Producing a sound wave

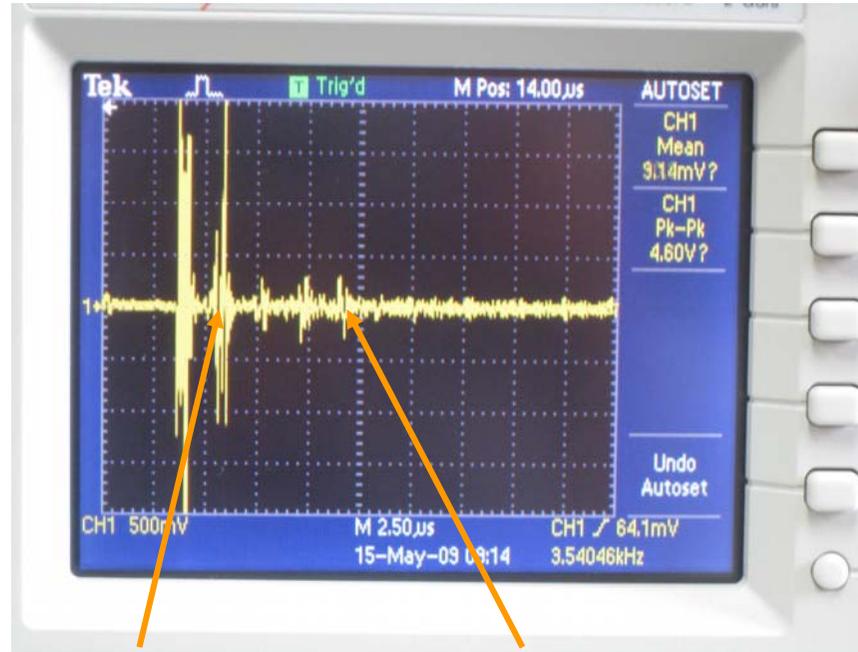

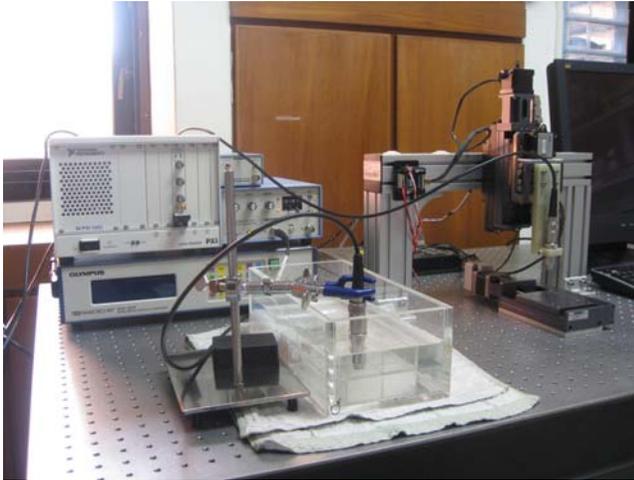

Ultrasound transducer

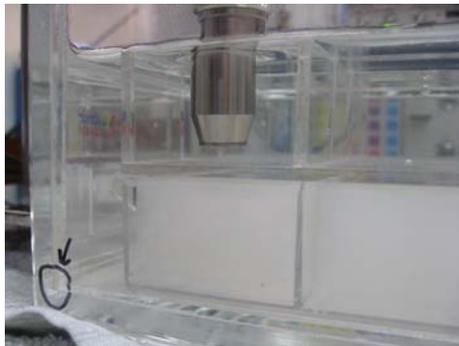

<http://www.wikiradiography.com/page/Ultrasound+Physics>

# Receiving echoes

Reflection signal

Scattering signal

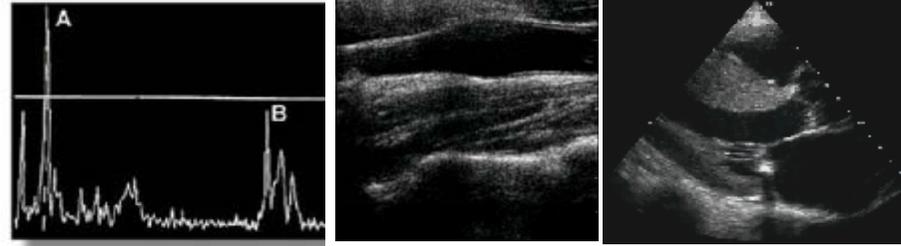

# Receiving echoes

- Pre-amplification
- Depth (Time) Gain Compensation
- Compression
- Demodulation
- Other signal processing

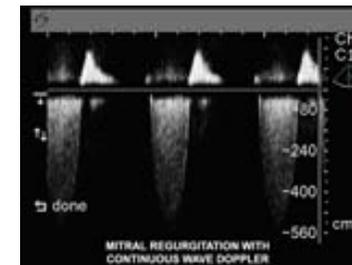

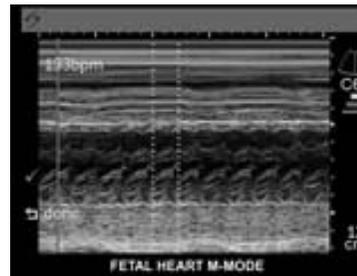

# Interpreting the echoes

● A-mode: Amplitude

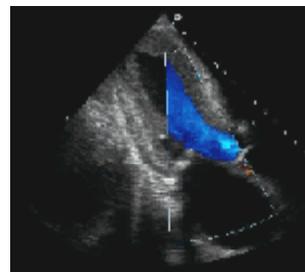

● B-mode: Brightness

● M-mode: Motion

● D-mode: Doppler

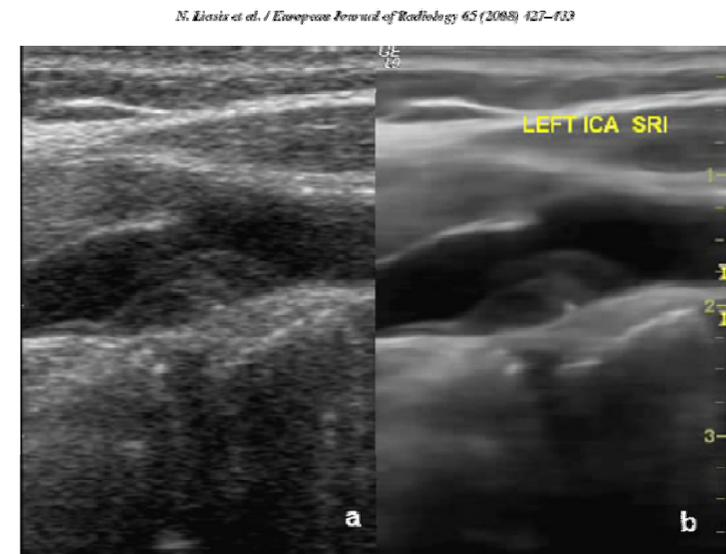

● E-mode: Energy

<http://www.frca.co.uk/article.aspx?articleid=300>

# What can a mathematician do?

- For example, Reducing noise or speckle
  - It may not be useful for an experienced doctor.
- Can we give more information from those echoes?
- Is it meaningful?
- How do we use them to help patients?

Image based on a generalized  
Rayleigh distribution

# Lord Rayleigh, 1842-1919

- Discovered the element: argon
  - Nobel Prize for Physics in 1904
- Discovered the phenomenon: Rayleigh scattering
- Predicted the existence of the surface waves:  
Rayleigh waves

*John William Strutt  
Rayleigh*

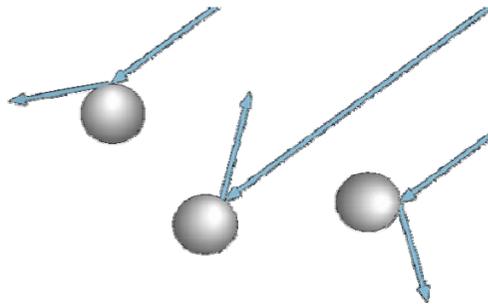

[http://en.wikipedia.org/wiki/John\\_William\\_Strutt,\\_3rd\\_Baron\\_Rayleigh](http://en.wikipedia.org/wiki/John_William_Strutt,_3rd_Baron_Rayleigh)

National Cheng Kung University

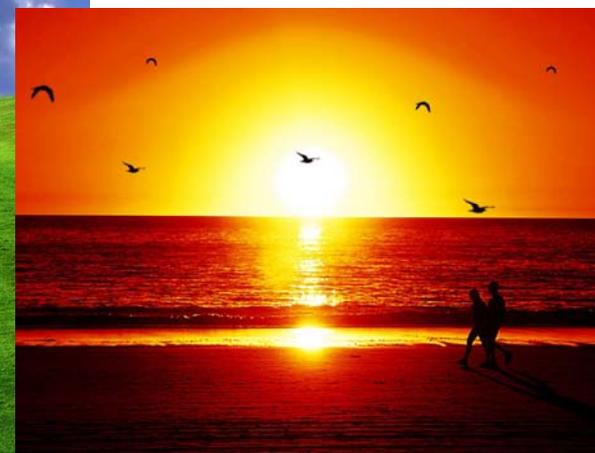

# Scattering

- Size of particles ( $S$ )
- wave length ( $\lambda$ )
- $S \ll \lambda$ : Rayleigh scattering
- $S \sim \lambda$ : Mie scattering
- $S \gg \lambda$ : Geometric optics (scattering)

# Blue Sky, white cloud, and red sunset

國立成功大學八十週年

# Why? Rayleigh scattering

The strong wavelength dependence of Rayleigh scattering enhances the short wavelengths, giving us the blue sky.

The scattering at 400 nm is 9.4 times as great as that at 700 nm for equal incident intensity.
